Cinevood integration implementation report

IMDbio movie search · poster & cast metadata · Gemini review drafts in your voice · YouTube trailers

Review date	Workspace branch	Database schema
31 October 2026	arena/e9a86fc0-cinenvood	Unchanged

Executive summary

The working tree now contains IMDbio-powered movie search/details (including posters and cast), official YouTube IFrame trailer playback, and Jarvis review drafting in the signed-in user's own writing style using the server-side Gemini key. Existing Q&A;, authentication, review flows, admin permissions, and Prisma schema were preserved. Live third-party credentials and a production database were not available for end-to-end verification.

Area	Result
IMDbio integration	Typed service client and UI for discovery, posters, ratings, metadata, and distinct IMDb reviews. Contract shape checked against imdbio 0.0.8.
Trailer playback	Official YouTube IFrame Player API; server-side search filters for embeddable videos, bounded timeouts, and quota/config errors.
Jarvis	Review-draft mode searches IMDbio and uses poster/cast metadata. With explicit consent, Gemini receives the user's notes and either up to five of that user's own published non-spoiler reviews or their own pasted writing sample. Drafts are never auto-saved/published. Existing Q&A remains source-grounded.
Build & security	TypeScript passes; npm audit reports zero vulnerabilities. Standard npm build is blocked locally by Prisma binary-host TLS access.

Important: this is an implementation report, not a production deployment certificate. No live IMDb, YouTube, Render, Vercel, or Gemini transaction was performed from this workspace.

What changed

Provider-backed movie discovery

- IMDbio service responses are parsed with runtime checks against verified search, detail, and review fields; malformed IDs and upstream failures have safe UI responses.
- IMDb, TMDB, and Cinevood community ratings/reviews are labeled separately. IMDb review excerpts remain provider content and are not reclassified as community reviews.
- FastAPI service auth uses constant-time token comparison and fails closed when its token is not configured.

Trailers and Jarvis

- YouTube playback uses the official IFrame Player API, with a normal YouTube link as an external fallback.
- Jarvis Q&A uses retrieved catalogue metadata and published, non-spoiler reviews with source labels. Review drafting uses IMDbio title metadata plus only the signed-in user's own writing samples and review notes; it cannot copy another member's voice or opinions. It requires explicit consent and never saves or publishes automatically.
- Admin AI review synthesis refuses to draft without eligible, title-specific community evidence. CLI saving creates a new editorial record rather than replacing an existing review.

Preservation and transparency

- No Prisma schema migration or auth-role changes were made. Existing Google OAuth, reviews, profiles, and admin flows were retained.
- Local Fontsource assets replace build-time Google Fonts downloads; package audit overrides resolve reported vulnerabilities.
- Legal/about copy discloses IMDbio, YouTube embedding, and the review-draft data sent to Gemini only after explicit consent.

Files of interest

`lib/imdbio.ts`, `app/imdb/[id]/page.tsx`, `app/api/imdb/trailer/route.ts`, `components/YouTubePlayer.tsx`, `app/api/jarvis/route.ts`, `components/JarvisAssistant.tsx`, and `imdbio-service/main.py`.

Validation and remaining gates

Check	Outcome	Notes
TypeScript	**PASS**	`npx tsc --noEmit`
npm audit	**PASS**	0 vulnerabilities (including production dependency audit).
Prisma schema/client	**PASS***	Schema validation and client generation used temporary WASM/client-engine settings; schema restored unchanged.
Next.js compile	**PASS***	`npx next build` completed with an engine-less client and dummy DB URL; Prisma datasource warnings mean this is not a clean production build.
Standard build	**BLOCKED**	`npm run build` could not download Prisma engine metadata from `binaries.prisma.sh` because of TLS/network access.
FastAPI contract/auth	**PASS**	Mocked health, token rejection, missing-token fail-closed behavior, and JSON serialization passed. No live upstream IMDb request.
App route smoke	**PASS**	GET /jarvis returned 200; malformed IMDb title ID returned 400; unauthenticated personal-style review-draft POST returned 401. No live provider keys used.
External integrations	**NOT RUN**	No live IMDbio upstream, YouTube API, Gemini API, Render service, or Vercel deployment test. Requires configured secrets and environment.

Preview status: the Next.js dev server is running on port 3000 and is exposed as the live preview. A real database is not configured in this sandbox, so DB-backed catalogue content/actions cannot be verified in the preview.

Image status: the two visuals at the end are explicitly illustrative UI mockups, not browser screenshots. Headless Chromium could not start because the sandbox lacks `libnspr4.so`. No mock review facts are presented.

Branch status: work remains on the Arena-managed branch `arena/e9a86fc0-cinenvood`. The separately named feature branch cannot be checked out or pushed from this session; this report does not imply that branch or its open PR was updated.

Deployment checklist

Before enabling the integrations in a real environment

- Deploy the IMDbio FastAPI service with a strong server-only service token; set the matching URL/token in the web app. Keep the public health endpoint separate from protected search/detail endpoints.
- Set YouTube Data API key server-side; configure quota alerts. The player API uses the official iframe embed and only accepts validated video IDs.
- Set Gemini API key server-side for Jarvis Q&A and personal-style review drafts. Do not place provider keys in NEXT_PUBLIC variables.
- Configure production Supabase/Postgres URLs and the existing Google OAuth/session secrets. No schema migration is included in this feature.
- Run a real build with Prisma engine download available, then verify login, My Reviews, admin permissions, catalogue details, review moderation, and mobile navigation.
- Run live smoke tests for IMDbio service auth/search/poster/cast, YouTube search/player playback, Jarvis citations/abstentions, and signed-in personal-style review drafts with explicit consent.

Trust and editorial controls

Jarvis Q&A uses retrieval; personal-style reviews use per-request prompting over only the signed-in user’s own writing samples and notes. Neither mode fine-tunes a model. Outputs may still be wrong; source labels, editorial review, and user editing remain necessary. Review drafts never auto-save or auto-publish.

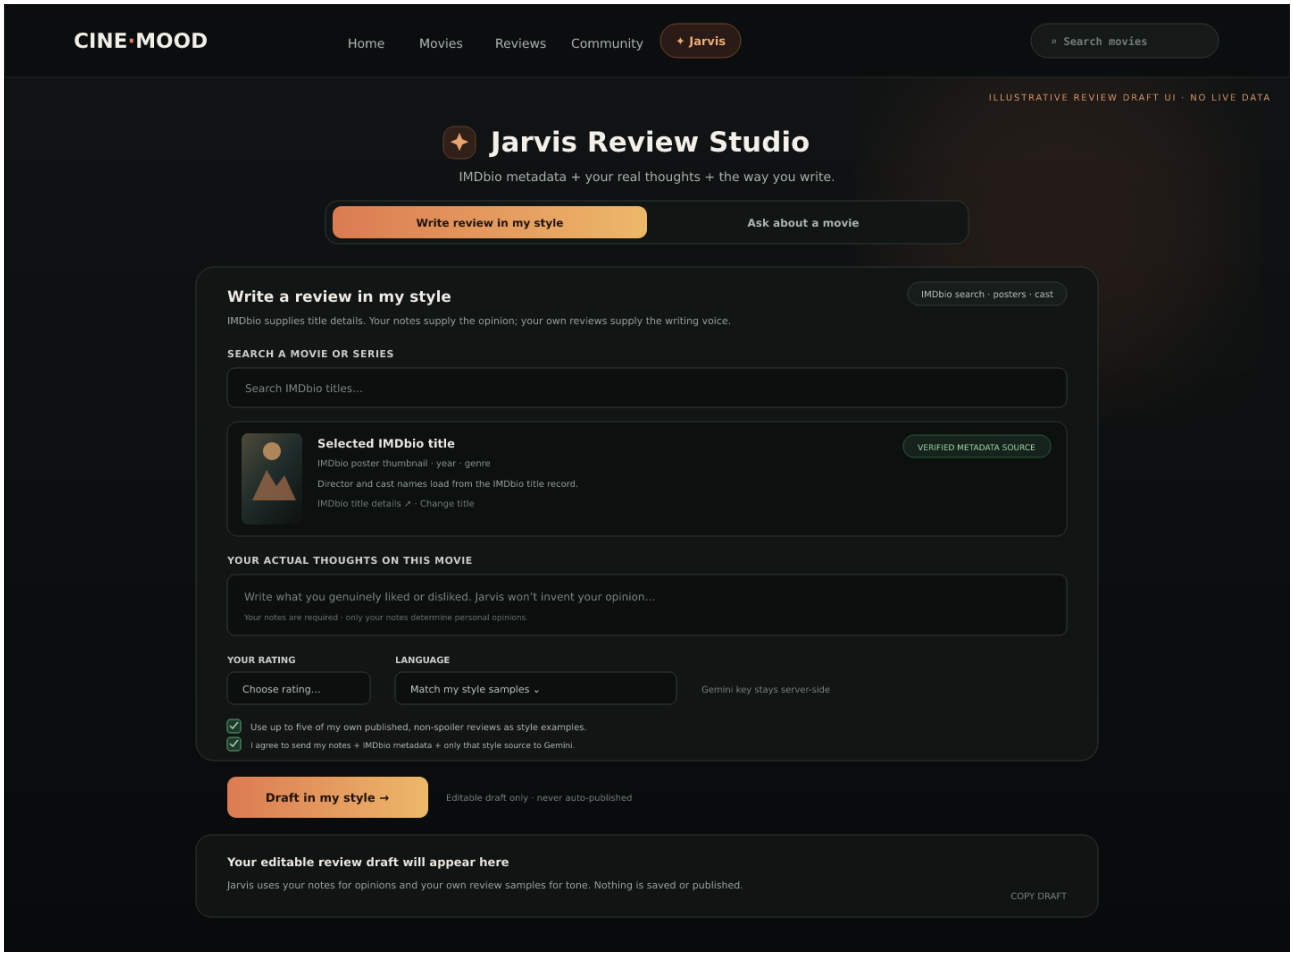

Worktree branch and release status

Current branch: `arena/e9a86fc0-cinenvood`. It is distinct from `feat/imdbio-youtube-trailers`; the existing PR on that feature branch has not been updated by this session. No production deployment is represented by this report.

Visual previews (illustrative)

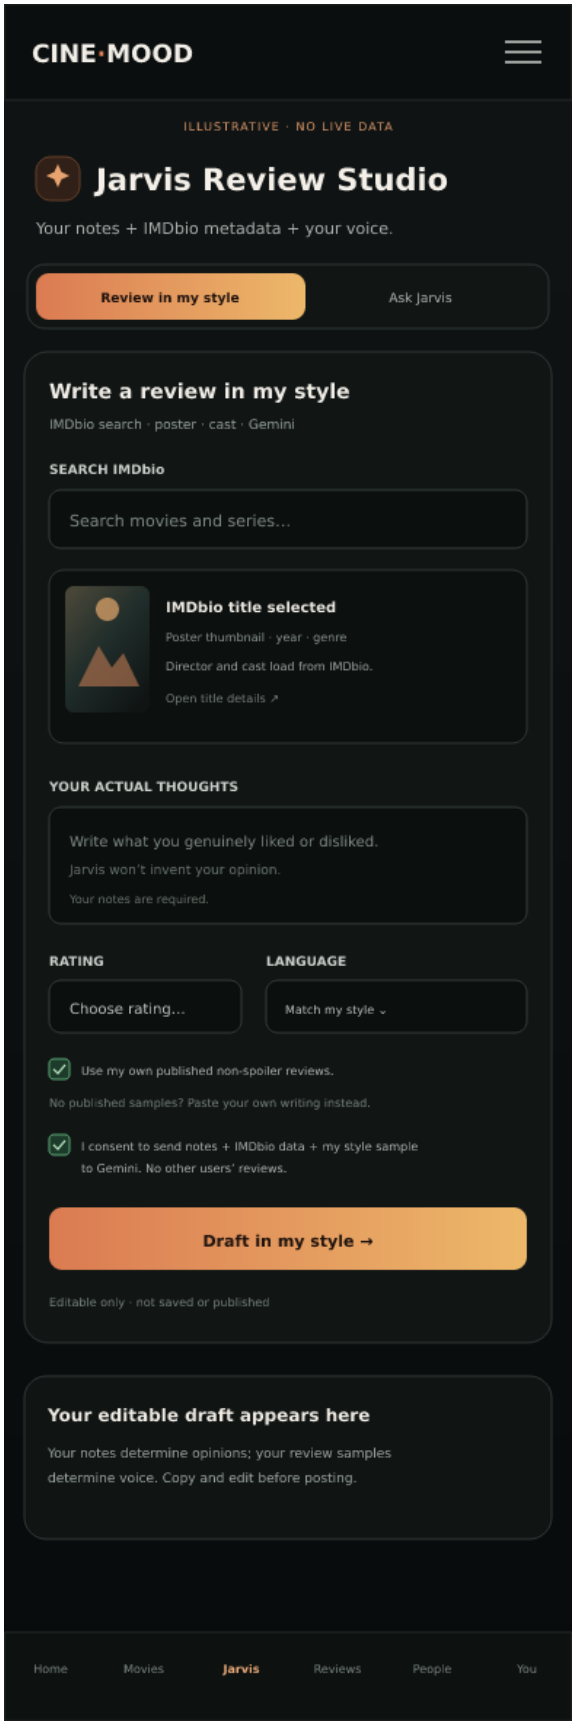

These images depict the Jarvis interaction concept and use placeholder copy. They are included for layout review only; the database-backed app should be verified in an environment with a working database and real browser capture.

Desktop concept · IMDbio search and personal-style review draft · illustrative mockup, no live data

Illustrative only — not captured from the running application.

Mobile concept · IMDbio poster/cast selection, user-notes form, consent, and editable draft area · illustrative mockup

Illustrative only — not captured from the running application.
